#### **NAME**

epstopdf, repstopdf - convert an EPS file to PDF

## **SYNOPSIS**

epstopdf [options] [epsfile [pdffile.pdf]]

## **DESCRIPTION**

By default, **epstopdf** converts the input PostScript file to PDF, using Ghostscript.

**Epstopdf** transforms the Encapsulated PostScript file *epsfile* (or standard input) so that it is guaranteed to start at the 0,0 coordinate, and it sets a page size exactly corresponding to the BoundingBox. Thus, the result needs no cropping, and the PDF MediaBox is correct.

By default, the output name is the input name with any extension replaced by **.pdf**. An output name ending with .pdf can also be given as a second argument on the command line, or the **--outfile** (**-o**) option can be used with any name.

PJL commands at the start of a file are removed. DOS EPS binary files (TN 5002) are supported.

If the bounding box in the input is incorrect, of course there will be resulting problems.

## **OPTIONS**

Options may start with either "-" or "--", and may be unambiguously abbreviated. It is best to use the full option name in scripts to avoid possible collisions with new options in the future.

General script options:

--help display help message and exit

#### --version

display version information and exit

## --outfile=file

write result to *file*. If this option is not given, and **--nogs** or **--filter** is specified, write to standard output; otherwise, the default is to construct the output file name by replacing any extension in the input file with '.pdf'.

# --[no]debug

write debugging info (default: false).

#### --[no]exact

scan ExactBoundingBox (default: false).

#### --[no]filter

read standard input and (unless --outfile is given) write standard output (default: false).

### --[no]gs

run Ghostscript (default: true). With **--nogs**, output (to standard output by default) the PostScript that would normally be converted; that is, the input PostScript as modified by **epstopdf**.

# --[no]hires

scan HiresBoundingBox (default: false).

#### --restricted=val

turn on restricted mode (default: [true for repstopdf, else false]); this forbids the use of **--gscmd** and other options and imposes restrictions on the input and output file names according to the values of openin\_any and openout\_any (see the Web2c manual, http://tug.org/web2c).

Options for Ghostscript (more info below):

### --gscmd = val

pipe output to val (default: [gswin32c on Windows, else gs])

## --gsopt=val

include val as one argument in the gs command (can be repeated).

### --gsopts=val

split *val* at whitespace and include each resulting word as an argument in the gs command (can be repeated).

## --autorotate=val

set AutoRotatePages (default: None); recognized *val* choices: None, All, PageByPage. For EPS files, PageByPage is equivalent to All.

#### --[no]compress

use compression in the output (default: true); if turned off, passes -dUseFlateCompression=false.

#### --device=dev

use -sDEVICE=dev (default: pdfwrite); not allowed in restricted mode.

## --[no]embed

embed fonts (default: true); passes -dMaxSubsetPct=100 -dSubsetFonts=true -dEmbedAllFonts=true.

#### --[no]gray

grayscale output (default: false); passes -sColorConversionStrategy=Gray -dProcessColorModel=/DeviceGray.

# --pdfsettings=val

use -dPDFSETTINGS=/val (default is 'prepress' if **--embed**, else empty); recognized val choices: screen, ebook, printer, prepress, default.

#### --[no]quiet

use -q, a.k.a. -dQUIET (default: false).

#### --res=dpi, dpixdpi

set image resolution (default: [use gs default]); ignored if --debug is set.

#### --[no]safer

```
use -d(NO)QUIET (default: true).
```

In addition to the specific options above, additional options to be used with gs can be specified with either or both of the two cumulative options **--gsopts** and **--gsopt.** 

- **--gsopts** takes a single string of options, which is split at whitespace, each resulting word then added to the gs command line individually.
- **--gsopt** adds its argument as a single option to the gs command line. It can be used multiple times to specify options separately, and is necessary if an option or its value contains whitespace.

In restricted mode, options are limited to those with names and values known to be safe. Some options taking booleans, integers or fixed names are allowed, those taking general strings are not.

## **EXAMPLES**

```
These examples all equivalently convert 'test.eps' to 'test.pdf':
```

epstopdf test.eps

epstopdf test.eps test.pdf

cat test.eps | epstopdf --filter >test.pdf

cat test.eps | epstopdf -f -o=test.pdf

Example for using HiResBoundingBox instead of BoundingBox:

epstopdf --hires test.eps

Example for **epstopdf**'s attempt at correcting PostScript:

\$program --nogs test.ps >testcorr.ps

In all cases, you can add **--debug** (**-d**) to see more about what **epstopdf** is doing.

# **BUGS**

The case of "%%BoundingBox: (atend)" when input is not seekable (e.g., from a pipe) is not supported.

Report bugs in the program or this man page to tex-k@tug.org. When reporting bugs, please include an input file and the command line options specified, so the problem can be reproduced.
